

Why HCM Analytics

In business the rear view mirror is always clear but the windshield is hazy. Business leaders expect HR to widen its focus from traditional headcount reporting to predictive analytics and demonstrate by evidence that how investment in human capital creates value for stakeholders and drives future business decision making.

How HCM Analytics Software is Different from Traditional HRMS

Traditional HRMS' provide basic HR logistical data like no of people hired, trained, paid, surveyed or appraised. This type of data is more of "accounting" of HR and being transactional, it is of little value to business leaders in making informed decision pertaining to workforce management.

Like finance uses the accounting data to build certain key ratios which are used at management level to analyze the financial health of an organization, similarly human capital analytics help in future forecasting and economic viability of workforce investments.

Anyone can generate 50 or more metrics but to demonstrate to the business that x percent increase/decrease in an human capital management factor corresponds to how much change in business performance and ultimately financial performance, takes its toll and effort. Only vital few measurements make the difference.

Reporting employee turnover for every position in an organization may seem to business leaders an administrative exercise for HR department. They are interested to see the economic consequences of turnover in strategic talent that is pivotal to the business and difficult to replace. Also the business leader are interested to see net improvement in retention and its financial impact on account of saving in rehiring, retraining and opportunity loss of revenue.

Purpose of HCM Analytics

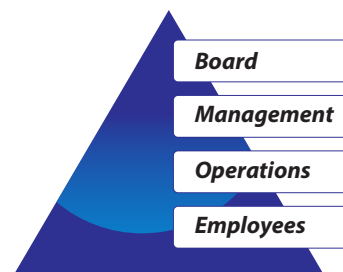

Benefits of HCM Analytics
